1. General information

1.1 Identification of the EUT

Product:	Bluetooth Blood Pressure Monitor for Arm
Model No.:	HPL-308
FCC ID.:	YRM-HPL-308
Frequency Range:	2402 MHz ~ 2480 MHz
Channel Number:	79 channels
Rated Power:	DC 6 V from batteries
Power Cord:	N/A
Data Cable:	N/A
Sample Received:	Aug. 19, 2010
Test Date(s):	Aug. 26, 2010 ~ Aug. 27, 2010

Note 1: This report is for the exclusive use of Intertek's Client and is provided pursuant to the agreement between Intertek and its Client. Intertek's responsibility and liability are limited to the terms and conditions of the agreement. Intertek assumes no liability to any party, other than to the Client in accordance with the agreement, for any loss, expense or damage occasioned by the use of this report. Only the Client is authorized to permit copying or distribution of this report and then only in its entirety. Any use of the Intertek name or one of its marks for the sale or advertisement of the tested material, product or service must first be approved in writing by Intertek. The observations and test results in this report are relevant only to the sample tested. This report by itself does not imply that the material, product, or service is or has ever been under an Intertek certification program.

Note 2: When determining the test conclusion, the Measurement Uncertainty of test has been considered.

1.2 Additional information about the EUT

The main function of HPL-308(EUT) is to send 2.4GHz Bluetooth RF signals.

The model listed below is identical to model HPL-308 (EUT).Different brand serves as marketing strategy.

Trade Name	Model Number
IVT	IVT-BPM02
-	HPL-308

1.3 Antenna description

The EUT uses a permanently connected antenna.

Antenna Type: Chip antenna

Connector Type: N/A

2. Test specifications

2.1 Test standard

The EUT was performed according to the procedures in FCC Part 15 Subpart C Paragraph 15.249 for non-spread spectrum devices.

The test of radiated measurements according to FCC Part15 Section 15.33(a) had been conducted and the field strength of this frequency band were all meet limit requirement, thus we evaluate the EUT pass the specified test.

2.2 Operation mode

The EUT was continuously transmitting during the test.

The EUT has GFSK, $\pi/4$ DPSK and 8DPSK modulations. After verifying the three modulations, we found the maximum output power was occurred at low channel by GFSK modulation. The final test was executed under this condition and recorded in this report individually.

3. Radiated emission test FCC 15.249 (C)

3.1 Operating environment

Temperature:	22	°C
Relative Humidity:	56	%
Atmospheric Pressure	1024	hPa

3.2 Test setup & procedure

The Diagram below shows the test setup, which is utilized to make these measurements.

Radiated emissions were investigated cover the frequency range from 30MHz to 1000MHz using a receiver RBW of 120kHz record QP reading, and the frequency over 1GHz using a spectrum analyzer RBW of 1MHz and 10Hz VBW record Average reading. (15.209 paragraphs), the Peak reading (1MHz RBW/VBW) recorded also on the report. The EUT for testing is arranged on a wooden turntable. If some peripherals apply to the EUT, the peripherals will be connected to EUT and the whole system. During the test, all cables were arranged to produce worst-case emissions. The signal is maximized through rotation. The height of antenna and polarization is changing constantly for exploring for maximum signal level. The height of antenna can be up to 4 meters and down to 1 meter.

The measurement for radiated emission will be done at the distance of three meters unless the signal level is too low to measure at that distance. In the case of the reading under noise floor, a pre-amplifier is used and/or the test is conducted at a closer distance. And then all readings are extrapolated back to the equivalent three meter reading using inverse scaling with distance.

The EUT configuration please refer to the “Spurious set-up photo.pdf”.

3.3 Emission limit

3.3.1 Fundamental and harmonics emission limits

Frequency (MHz)	Field Strength of Fundamental		Field Strength of Harmonics	
	(mV/m@3m)	(dBuV/m@3m)	(uV/m@3m)	(dBuV/m@3m)
2400-2483.5	50	94	500	54

3.3.2 General radiated emission limits

Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50dB below the level of the fundamental or to the general radiated emission limits in paragraph 15.209, whichever is the lesser attenuation.

Frequency MHz	15.209 Limits (dB μ V/m@3m)
30-88	40
88-216	43.5
216-960	46
Above 960	54

Remark:

1. In the above table, the tighter limit applies at the band edges.
2. Distance refers to the distance in meters between the measuring instrument antenna and the closed point of any part of the device or system

Measurement uncertainty was calculated in accordance with TR 100 028-1.

Parameter	Uncertainty
Radiated Emission	± 5.10 dB
Conducted Emission	± 2.786 dB

This uncertainty represents an expanded uncertainty expressed at approximately the 95 % confidence level using a coverage factor of k=2.

5. Calculation of Average Factor

The specification for output field strengths in accordance with the FCC rules specify measurements with an average detector. During testing, a spectrum analyzer incorporating a peak detector was used. Therefore, a reduction factor can be applied to the resultant peak signal level and compared to the limit for measurement instrumentation incorporating an average detector.

The time period over which the duty cycle is measured in 100 ms or the repetition cycle, whichever is a shorter time frame. The duty cycle is measured by placing the spectrum analyzer in zero span mode.

Averaging factor in dB = $20\log(\text{duty cycle})$

The duty cycle is simply the on-time divided by the period:

Duty cycle correction factor in dB = $20\log(\text{on-time}/100\text{ms})$ or $20\log(\text{on-time}/\text{period})$
#If period is smaller than 100ms

Result:

Mode	Mode	Pulse time (ms)	No. of pulse during 100ms	Duty cycle %	Duty cycle correction factor
GFSK	DH1	0.4174	2	0.8349	-41.57
	DH3	1.6665	1	1.6665	-35.56
	DH5	2.8990	1	2.8990	-30.76
$\pi/4$ DPSK	DH1	0.4255	2	0.8510	-41.40

	DH3	1.6786	1	1.6786	-35.50
	DH5	2.9110	1	2.9110	-30.72

The worst case of GFSK mode is -30.76, $\pi/4$ DPSK mode is -30.73, 8DPSK mode is -30.72.

6. Additional provisions test (FCC 15.215)

6.1 Operating environment

Temperature:	25	°C
Relative Humidity:	50	%
Atmospheric Pressure:	1008	hPa

6.2 Procedure of test setup & limitation

The additional provisions mean the device must be designed to ensure that the 20dB bandwidth of the emission or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated.

This requirement per FCC §15.215 (c) was measured from the antenna port of the EUT using a 50ohm spectrum analyzer with the resolution bandwidth set at 100kHz (approximately 1% of the emission bandwidth), the video bandwidth set at 100kHz (VBW \geq RBW).
